Science and Engineering at Yale

A Guide to Undergraduate Research, Teaching, and Resources
World-class research and undergraduate education come together at Yale.
Science and Engineering Leadership in an Age of Opportunity

Yale scientists and engineers are changing the world with breakthrough research in astrophysics, medicine, nanotechnology, and many other fields. Undergraduates at Yale have extraordinary access to this groundbreaking work through research opportunities and mentorships with senior faculty in tandem with the focus on undergraduate education that has long been the hallmark of the Yale College experience.

We seek students who are ambitious, who desire to serve society through scientific achievement, and who will make the most of the incredible opportunities here. As an aspiring engineer, mathematician, or scientist, you owe it to yourself to consider applying to Yale.

Peter Salovey, President of Yale University
Capital “R” Research.

(Pioneering discoveries by students)

Research with a capital “R” is about discovering something that nobody else has ever known. Yale undergraduates have that opportunity, since so many are doing their own research as early as the summer after their freshman year. The process of doing real science here is a bit like an apprenticeship, where students learn by doing, from professors, other students, and other scientists. While working with and learning from scientists at the forefront of some of today’s most exciting research, they become part of the world’s scientific community.

Axel Schmidt
Hometown Pittsburgh, PA
Major Physics Intensive.
(The Physics major has two tracks: B.S. and B.S. Intensive. The latter is designed for students who want to continue on to graduate school, while the former offers more flexibility for students who want to complete the pre-med curriculum, double-major, or combine physics with another field like philosophy or astronomy.)

Extracurriculars Purple Crayon improv comedy, intramural sports, Peer Health Education

Why Yale “I chose Yale over a more technical university because I wanted a peer group that had a broader range of academic interests. I also wanted to be taught English, history, and music by professors who were leaders in those fields as well. If I were to make that choice again knowing what I know now, I would choose Yale for those reasons but also because at Yale, science majors are a little less common. We get special treatment for it. I was given a huge amount of support—academic and financial—to pursue research from the moment I got here. That has been the most valuable thing that Yale has offered.”

Post-Yale Plan “I’m headed to graduate school next year, to get a Ph.D. in physics. I haven’t made up my mind about where I’m headed, but I did get into MIT, Duke, Columbia, and Yale, so I have terrific options.”

Atomic Sweat

“Science is fundamentally about research. Regardless of how many classes you take or how much math you learn, you haven’t really done science unless you’ve poured sweat into your own lab project, computer program, or solar-powered robot. I had the tremendous opportunity to start working in a laboratory the summer after my freshman year, and in that time, I found that I love doing science. Research wasn’t about grinding out problem sets, but getting to tackle puzzles that nobody had ever seen or thought about before. It was about getting to ask the questions that I thought were interesting and important. On top of that, in classes from then on, I started thinking about questions like ‘How would one measure that in the lab?’ Or ‘What kinds of experiments make use of this principle?’”

“My research explores the structure of atomic nuclei. I am hoping to explain how removing neutrons from a heavy nucleus changes its structure from largely spherical and stable, to deformed and unstable. In my experiments, I measure the gamma rays emitted from nuclei created in Yale’s particle accelerator, and then use these measurements to recover the excited states of these nuclei.

“In my sophomore fall, I went with the rest of my lab to a conference and presented my research from the previous summer. Here I was, a sophomore, being asked questions by leaders in the field from all over the country. It was an amazing experience, and I made sure I went back to that conference every year after that. If I hadn’t done research, I never would have glimpsed the larger scientific community, and where I fit in.”
I came to Yale with a background in robotics but wanted to explore other areas of science and engineering, too. My freshman- and sophomore-year summers took me to CERN in Switzerland, site of the world’s largest and highest-energy particle accelerator. While conducting data-processing research there, I realized that my true interest lay in the engineering of the particle detector. Back at Yale, I began work in the Center for Systems Science, researching pattern recognition.

These experiences taught me that I still wanted to build physical systems, and my senior project led me back to robotics when my team decided to construct a device that could retrieve objects dropped off a boat or dock into the water. We produced a cost-effective, practical solution: a tele-operated robotic arm. We mounted a miniaturized version of the arm on a control box outfitted with a video feed of the underwater scene to allow the user to steer the submerged arm while watching its movements in real time. None of us had designed anything for underwater use, which made for a challenge as we researched waterproof materials and considered factors such as the buoyancy of the arm.

For me, engineering demands an energizing combination of the creative and the concrete. We took theory that we’d learned through course work, made it our own by applying it to design development, and saw it all come to fruition as a working device—one that could improve someone’s quality of life. This is a great feeling.”

Brigid

Bio-Prospecting

“Yale without my rain forest research would have been a very different place. Almost no one goes bio-prospecting for endophytes in the Amazon rain forest. So my mentor, Professor Scott Strobel, a world leader in understanding catalytic reactions triggered by RNA, knew the students in his Amazon Rain Forest Expedition and Laboratory were likely to find things no one else had seen.

“What we discovered blew us away. We returned with ten species of fungal endophytes that we have been able to classify as an entirely new genus. Even more exciting for me was that, once we got back to the lab, I discovered that an extract from one of these fungal endophytes reduces inflammation in human tissue. A subsequent analysis of the molecule revealed it to be an inhibitor of apoptosis, or programmed cell death. It may also lead to drugs that could prevent preterm birth—something we’re continuing to investigate both in the lab and with further prospecting in Ecuador.”

“I’ve had multitudes of opportunities to present this research in all sorts of settings, including informal lab meetings, undergraduate symposia, professional conferences, general public and classroom talks, and even a talk for the president of the University and his council on international affairs. In addition, I have been working on publishing my results in scientific journals. In all of these endeavors, I have had support and encouragement from my faculty advisers. “My research experience has absolutely been an invaluable and integral part of my undergraduate education here. It’s also had a direct impact in defining my future goals.”

Sunjin

Why Yale

“I chose Yale over a technical school because its relatively small engineering program provides remarkable resources to undergraduates. From freshman year on, I gained access to high-level research opportunities and worked closely with supportive faculty. The seminar-style courses are also a bonus because professors can tailor material to students’ individual interests. Plus, I love Yale’s student community and the way people interact with one another here.”

Post-Yale Plan

“I will pursue a Ph.D. in robotics, with the hope of one day combining engineering research with the opportunity to teach.”

Sunjin Lee

Hometown: Vancouver, WA

Major: Molecular Biophysics and Biochemistry

Extracurriculars: "Aside from scientific research, I love to pursue my interests in classical music. I play oboe with a couple of different chamber groups and orchestras, and also enjoy playing in pit orchestras for operas."

Why Yale: "Beautiful campus, amazing people, and countless opportunities for anything and everything you could possibly be interested in. Yale also had one of the best financial aid packages among all of the schools I had to choose from."

Post-Yale Plan: "I will be pursuing a career in translational research, which bridges gaps between basic science and clinical medicine."

Brigid Blakeslee

Hometown: Oradell, NJ

Major: Mechanical Engineering

Extracurriculars: Student researcher, head science and engineering tour guide, president of Yale’s Institute of Electrical and Electronics Engineers, co-founder of Yale’s Society of Women Engineers, bagpiper, Scottish Highland dancer

Why Yale: "I chose Yale over a technical school because it’s beautiful campus, amazing people, and countless opportunities for anything and everything you could possibly be interested in. Yale also had one of the best financial aid packages among all of the schools I had to choose from."

Post-Yale Plan: "I will pursue a Ph.D. in robotics, with the hope of one day combining engineering research with the opportunity to teach."
Driving Curiosity

“There’s something about going out and trying to answer a novel question, or collect new data on something that’s never been studied before, that’s so rewarding and makes me feel like I’m making contributions to something new. Lab research has been very important not only in giving me hands-on experience, but also in showing me that I enjoy it. Perhaps most importantly, I’ve learned that I can do research and that I’m less concerned about my prospects as a researcher in the future. The lab that I work in does terahertz (THz) spectroscopy, which is a kind of vibrational spectroscopy. The project I’m working on is the study of single-crystal and polycrystalline amino acids using this and another technique called Raman spectroscopy to look at collective vibrations of molecules in a lattice.

“Learning in a lab is so much more proactive than the classroom. Something is interesting, and so you go and learn about it. Your own interests drive your curiosity, which I find makes learning much easier.”

Benjamin

Getting Your Hands Dirty

“When I was a sophomore, I was looking for a campus job. I went to the chair of the Chemical Engineering department and asked what was available. He told me that the policy of the department was to give a research position to every student who wanted to participate. That’s a pretty incredible thought—that Yale has the resources and the faculty support to encourage every undergrad to do research.

“I worked with Robert McGinnis on forward osmosis desalination for two years. Rob, who earned a doctorate in Environmental Engineering, is revolutionizing the industry. While at Yale he started a company that uses the new technology he’s developed. I feel lucky to have been a part of that. Beyond the intellectual benefits of participating in a working laboratory, I learned about the importance of humility in research. Rob and I were doing important work that I truly believe will be a viable technology within the decade. It has the potential to change the way we think about potable water. However, our experiments could be thwarted by a simple leak. I spent so many hours clambering over our prototype, tightening bolts.

“That’s what research is all about—having the intellectual prowess to problem-solve in an efficient and innovative way, but also having common sense and a willingness to get your hands dirty. Persistence is important.”

Lee

Lee Christoffersen
Hometown Littleton, CO
Major Environmental Engineering Intensive and Geology and Natural Resources
Extracurriculars Research assistant, science and engineering tour guide, sustainability coordinator, Engineers Without Borders, founding member of Yale’s Society of Women Engineers
Why Yale “I thought I wanted to study astrophysics. When I visited Yale, the college set up a personal meeting with Professor Meg Urry. This renowned scientist took me out to lunch! I’ve had the opportunity to take classes in the humanities and social sciences—classes taught by really incredible professors. Scientific fields are inextricably tied to politics, the economy, and social values. It’s vital to understand these other factors.”
Post-Yale Plan “I am interested in the environmental aspect of the mining industry. I’ve had three summer internships focused on the topic. I’ve worked on the design of a tailing storage facility, environmental and social impact assessments, closure plans, and acid rock drainage treatment.”

Benjamin K. Ofori-Okai
Hometown Albany, NY
Major Chemistry
Extracurriculars Yale Anti-Gravity Society, Pierson College Master’s Aide, Pierson College Butterfly, Association of Undergraduate Chemistry Students, Society of Physics Students
Why Yale “I chose Yale because I can dedicate the rest of my life to science, but not necessarily to all the other things I am interested in. Some of my greatest learning has come from the conversations with my friends who major in history, philosophy, and classics.”
Post-Yale Plan “I am going to graduate school to earn my Ph.D. with the goal of becoming a professor.”
Solar Decathlon
A team of eight Yale College students, led by sophomore Architecture majors Katherine McMlland and Juan Pablo Ponce de Leon, was selected by the U.S. Department of Energy to be one of twenty collegiate teams competing in the next Solar Decathlon—the first Yale team to participate in the prestigious contest. The team, which includes students majoring in Electrical, Environmental, and Mechanical Engineering and in Geology and Geophysics, will spend almost two years building an affordable and energy-efficient solar-powered house for the Decathlon, which takes place in California in October 2015.

Undergraduate Entrepreneurs
Yale undergraduates head three of the eight business ventures that earned summer fellowships from the Yale Entrepreneurial Institute in 2014. The program is geared toward scalable ideas with high-growth potential. This year’s projects include development of an organic, non-GMO sports drink; a mobile mesh network that offloads cellular data demand from overloaded cell towers; and a medical device to improve treatment of scoliosis by tracking how long and how tightly the braces are worn over time.

Social Innovation
The inaugural Thorne Prize for Social Innovation in Health, sponsored by the School of Public Health, was won by a team of four Yale students—including undergraduates Rachit Nagar, Ifedolapo Owimole, and Leen van Besien—for Khushi Baby, a bracelet for infants that is embedded with a silicone chip that records their vaccination history. The students, who developed the bracelet in the course Appropriate Technology and the Developing World, will use the $25,000 prize to begin work on implementing their health innovation in India. Other projects in the course, which focused this year on vaccine delivery issues, included a real-time temperature monitoring system that fits into portable vaccine storage containers; a modular packaging design that keeps vaccines at the ideal temperature longer; and a pre-dosed, single-use vaccine administrator.

24 Hours
Yale College teams won both the first and second prizes at Y-Hack, a national twenty-four-hour hackathon held at Yale. Seniors Geoffrey Litt and Seth Thompson earned top honors for “Rainman,” a Chrome extension that identifies key phrases in an online article and creates sidenotes with contextual information and images. Senior Sean Haufieller and sophomore Matthew Rajcok won second prize for “Lux,” an app that varies the brightness and hue of the lights in your home according to the time of day. Y-Hack, which was founded by three Yale College classmates in 2012, drew more than 1,000 coders from about seventy-five schools across the country and Canada.

Post-Yale Fellowships
Four Yale seniors majoring in STEM disciplines have been awarded some of the country’s most prestigious fellowships for postgraduate study next year. Isabel Beshar, a double major in Molecular, Cellular, and Developmental Biology and History of Science and Medicine, will study medical anthropology at Oxford and plans to go on to medical school and a career in global health. Benjamin Horowitz, Katherine Lawrence, and Colin Pavlovski—and twenty-one recent Yale College alumni—earned National Science Foundation Graduate Research Fellowships. Horowitz, a Mathematics and Physics major, is off to study astrophysics and particle physics at UC Berkeley. Lawrence, a Physics Intensive major, also earned a Hertz Fellowship; she will be studying experimental atomic molecular and optical physics at MIT. Mathematics Intensive major Pavlovski will also be at MIT, pursuing a doctorate in Operations Research.

Class Kudos
Seniors Andrew Crouch, Brian Loeb, Raja Narayan, Natalie Pancer, and Kristi Oki—all students in the new Yale College course Medical Device Design and Innovation—designed an intestinal transport system that could significantly improve the success rate of intestinal transplants. The group, which plans to work with Connecticut-based organ banks to conduct a trial with human tissue, presented its project at the annual meeting of the Society for Surgery of the Alimentary Tract in May. Other projects in the course included a portable device to record epileptic seizures, a surgical tool for ENT procedures, and a drug-delivery system for pediatric hemophilia patients.

Rookie of the Year
Competing against more than forty international teams at the 2014 Intelligent Ground Vehicle Competition (IGVC) in Rochester, Michigan, in June, the Yale Undergraduate Intelligent Vehicles team earned both the Rookie-of-the-Year Award and fourth place in the Design competition. Each team’s autonomous robotic vehicle had to navigate a flagged course, driving to a series of GPS waypoints without running into any traffic barrels or crossing any painted lines.

Artsy Meets Technology
For his senior project, Computing and the Arts major Shio Matsuzaki wrote computer programs to produce a 25,000-node LED display on the walls and ceiling of the Ground café in Becton Engineering Center that combined music, dance, and technology. As members of the Yale dance team Rhythmic Blue performed in the middle of the café, an audience member used simple hand gestures to control the texture and speed of the music, and the color and intensity of the lights. Matsuzaki described the result as “a call and response between the manipulator and the dancer” that celebrates the beauty of human gesture and movement.

Lab Wear
Olivia Pavco-Giacca, a sophomore Cognitive Science major, is helping to promote the science among young girls by producing and selling fashionable lab wear that disproves stereotypes about how scientists look. Her start-up, LabCandy, has earned backing from the Yale Entrepreneurial Institute and was featured in March in an article on Nowness, a new digital media company focused on stories about innovation and renewal in America.

Tech Bootcamp
Twenty-six Yale undergraduates, majoring in fields from Chemistry to Environmental Studies, were among the thirty applicants chosen to participate in Yale’s second summer Tech Bootcamp. A partnership between the Yale Entrepreneurial Institute and the Yale Student Tech Collaborative, the ten-week, immersive, full-stack programming bootcamp provides students with coding experience that could be used to build their own start-ups or join an early-stage tech company. Project ideas that won over the selection committee include an app to translate medical questions into different languages, a taxi-sharing app, and a rhyming app for children.

Innovation Incubator.

(Yale scientists changing the world)

Translating basic research into new technologies that advance health and welfare has been part of Yale's "DNA" for centuries, and the pace of innovation here continues to accelerate dramatically. Today's Yale inventors are leading the way in science, medicine, and engineering through breakthrough research in nanomaterials, genetics, computational biology, biomedical engineering, and sustainable energy production. While "interdisciplinary" is a buzzword these days, the concept of bridging traditionally disparate fields, including biology and the life sciences, physics, chemistry, geology, mathematics, and engineering, is at the heart of this university's scientific endeavors. Here are just a few of our faculty and projects at the frontiers of discovery and making a real-world difference.

Portable Disease Detectors

Yale scientists have created nanowire sensors coupled with simple microprocessor electronics that are both sensitive and specific enough to be used for point-of-care disease detection. Using such detectors, says Tarek Fahmy, Yale associate professor of Biomedical Engineering, doctors could immediately determine which strain of influenza a patient has, whether or not there is an HIV infection, or what strain of tuberculosis or E. coli bacteria is present. Currently, there are no electronic point-of-care diagnostic devices available for disease detection.

Fahmy and his colleagues see a huge potential for the system in point-of-care diagnostic centers in the United States and in developing countries where health care facilities and clinics are lacking. He says it could be as simple as an iPod-like device with changeable cards to detect or diagnose disease. Importantly, the system produces no false positives—a necessity for point-of-care testing. "Instruments that are both sensitive and specific could also play a role in treatment testing," said Fahmy. "They will help with one of the greatest challenges we face in treatment of disease—knowing if we got rid of all of it."

Creating a Quantum Computer—One Artificial Atom at a Time

Robert Schoelkopf and Michel Devoret are creating basic building blocks for a future quantum computer. These computers of tomorrow, researchers say, will store, process, and transfer huge amounts of information unimaginably quickly and in spaces that are almost inconceivably small—visible only with an electron microscope. The two Applied Physics professors are among an elite group of experimentalists, working at the level of single microwave photons, tiny packets of light energy. The Schoelkopf lab has recently created the world's largest "Schrödinger Cat" consisting of a simultaneous quantum superposition of zero and 111 photons.

Schoelkopf is a former NASA engineer and Devoret was a director of research at the French Atomic Energy Commission before moving to Yale. At Yale, they are combining novel new designs for superconducting "artificial atoms" with tiny superconducting cavities to create electrical circuits that realize "microwave quantum optics on a chip," said Steven Girvin, a Yale theoretical physicist who collaborates on their project. The two scientists have managed to squeeze the tiny photons into ultra-small cavities on a chip, akin to a regular computer microchip. They've also squeezed "artificial atoms" that can act as quantum bits—units to process and store quantum information—into the ultra-small cavities. The tiny packets of energy from the microwaves interact with these small atoms a million times more strongly than if the atoms had been in a standard bigger cavity.

The cavity acts as a "quantum bus" allowing quantum information to be sent from one atom to another, forming the basis of a new architecture, the beginnings of what someday the researchers expect will be a huge integrated circuit of quantum bits. One practical application for quantum computers is cryptanalysis. "If quantum computers can be built," Girvin said, "they can very efficiently break certain types of codes."

Spinal Cord Injury Treatment

Stephen Strittmatter, Vincent Coates Professor of Neurology, helps discover the existence of a molecule, called Nogo, that shows remarkable promise in animal models for treating spinal cord injury, for which there is no current effective treatment.

New Class of Antibiotics

After imaging and "inventing" riboswitches, RNA sequences that can bind and act as sensors of various molecules, Ronald Breaker, Henry Ford II Professor of Molecular, Cellular, and Developmental Biology, and professor of Molecular Biophysics and Biochemistry, discovered natural riboswitches in the genomes of microorganisms. Riboswitches act as major control elements for gene expression. Yale start-up BioRelix was established to target these genetic elements by designing new classes of antibiotics.

Associate professor Tarek Fahmy (right) and graduate student Erin Steenblock
**Saving Lives through Genetics**

An amazing revolution is under way as it becomes possible to rapidly and cheaply sequence large portions of the human genome. The most common fatal diseases have underlying inherited components. Rapid advances in molecular genetics now make it possible to quickly and easily identify the genetic variants underlying these diseases, promising to transform the diagnostic and therapeutic approaches to these disorders.

Dr. Richard Lifton, Sterling Professor of Genetics, chair of the Department of Genetics at the Yale School of Medicine, and professor of Medicine, is one of the world’s leading experts and advocates of genome-wide analysis of human populations to find genetic links to diseases. He and Yale neurobiologist Dr. Murat Gunel recently discovered a genetic link to brain aneurysms, and their findings could lead to new tests to spot those at greatest risk. In addition, a postdoctoral fellow in Lifton’s lab, investigating the genetic causes of blood pressure variation, recently identified a previously undescribed syndrome associated with seizures, a lack of coordination, developmental delay, and hearing loss. The work illustrates the power of genetic studies not only to find causes of chronic ailments, but also to identify a common cause in a seemingly unrelated set of symptoms in different parts of the body.

“Our ability to unequivocally and rapidly define new syndromes and their underlying disease genes has progressed dramatically in recent years,” says Lifton. “A study like [the one identifying the new syndrome] would have taken years in the past, but was accomplished in a few weeks by a single fellow in the lab.” He says he hopes the research will not only help doctors identify people with the new syndrome but also lead to greater recognition that patients with apparently complicated syndromes may often have simple underlying defects that can be understood.

Ultimately, the ability to identify genes associated with human disease paves the way for “personalized medicine” in which treatments can be tailored to an individual’s specific genetic makeup.
Green Chemistry in Policy and Practice

Yale is easily one of the foremost centers in the world for green chemistry and green engineering. Indeed, “the father of green chemistry” is Yale chemist Paul Anastas. In 1991, when Anastas served as chief of the Environmental Protection Agency’s chemistry branch, he coined the term “green chemistry” to describe the design of safer chemicals and chemical processes to replace the use of hazardous substances. Today he leads Yale’s Center for Green Chemistry & Green Engineering.

One of Yale’s next generation of innovators in green chemistry and engineering is Julie Zimmerman, jointly appointed to the Department of Chemical and Environmental Engineering, where she is Donna L. Dubinsky Associate Professor of Environmental Engineering, and the School of Forestry & Environmental Studies, where she is Professor of Green Engineering. Through her engineering research, Zimmerman is working toward the next generation of products, processes, and systems based on efficient and effective use of benign materials and energy to advance sustainability. To enhance the likelihood of successful implementation of these next-generation designs, she also studies the effectiveness of and barriers to current and potential policies developed to advance sustainability. Together these efforts represent a systematic and holistic approach to addressing the challenges of sustainability to enhance water and resource quality and quantity, to improve environmental protection, and to provide for a higher quality of life.

Zimmerman and her colleagues proved that certain countries and some U.S. states stand to benefit from the use of compact fluorescent lighting in the fight against global warming, while the use of such lighting in some areas could actually be more harmful to the environment. Zimmerman is also part of an interdisciplinary team developing design guidelines for safer chemicals to minimize or eliminate toxicity concerns from new molecules being developed and introduced to the market.

Hunting for New Phenomena with the World’s Largest Atom Smasher

The Large Hadron Collider—the world’s largest atom smasher—was built in collaboration with thousands of scientists from hundreds of universities across the globe, including Yale. Keith Baker, Sarah Demers, Tobias Golling, and Paul Tipton, professors of Physics at Yale, use the Large Hadron Collider to investigate a number of current mysteries in the present theory of particle physics. Baker participated in the recent discovery of what is likely the elusive Higgs boson. Dubbed the “God particle,” the Higgs boson explains why every other particle has mass and would provide the missing link in the Standard Model—our current theoretical understanding of particle physics. Many of the Yale team will be working to understand the properties of this new particle, including Demers, who will be searching for rare Higgs decays. Golling and Tipton are searching for new discoveries, motivated by, among other things, dark matter, that elusive substance which neither emits nor absorbs light but accounts for approximately 25 percent of the universe’s mass. The four particle physicists carry out their experiments with the ATLAS, one of two general-purpose detectors at the Large Hadron Collider located at the CERN laboratory near Geneva, Switzerland. The Large Hadron Collider, which took nearly fifteen years to complete, was commissioned in 2008.
A New Class of Metals

Jan Schroers, professor of Mechanical Engineering, and his team have been exploring a class of materials called amorphous metals or bulk metallic glasses, BMGs, which can be molded like plastics and are more durable than silicon or steel. The team has created a process for making computer chips at the nano-scale that may revolutionize the industry. More recently Schroers has determined that BMGs have important biomedical applications—from stents to bone replacement. He and Themis Kyriakides, associate professor of Pathology and Biomedical Engineering, are working together to put the unique processibility of BMGs and their outstanding properties to the test. Their work targets three applications: bone replacement, soft tissue implants like stents, and surface patterning to program cellular response (synthetic membranes such as artificial kidneys).

Unlike most metals, BMGs have a tendency to avoid crystallization when solidified. It is their “amorphous” structure that yields many advantages including remarkable properties of high strength (three times that of steel), elasticity, corrosion resistance, and durability—all of which exceed the properties of currently used biomaterials. Most notable, however, is their unique processibility that allows them to be molded like plastics with nano-scale precision and complex geometries. This processing capability has only come with the recent emergence of thermoplastic forming, which decouples the fast-cooling process from the molding process, allowing the time needed for precision net-shaping.

Of course, the selection criteria for biomaterials include more than favorable mechanical and chemical properties and the ability to be precisely shaped—biocompatibility is an absolute necessity. “We knew we had a superior material over currently used implant materials, and we now have found out that we can indeed put it in the human body,” says Schroers.

Natural Proteins by Design

Scientists dream of the day when they can create designer proteins capable of inhibiting harmful interactions, modifying substrates, or guiding cellular machines to where they are needed within the body. Though that dream may be far down the road, Alanna Schepartz, Milton Harris Professor of Chemistry and professor of Molecular, Cellular, and Developmental Biology, took an important first step forward when she and her team created the first synthetic protein in the lab. “Creating artificial proteins is somewhat of a holy grail,” says Schepartz. “A fair number of people thought it would be impossible to synthesize a molecule that could come close to behaving like a natural protein that has benefited from billions of years of evolution.”

Schepartz’s team created a short β-peptide that assembles into a “octamer bundle” shape that exhibits all the traits of natural bundle proteins, but with some additional potential benefits. “Unlike natural peptides and proteins, β-peptides are not broken down by enzymes, not altered significantly by metabolism, and seem not to jump–start the immune system the way a foreign natural protein can," Schepartz says. That means scientists may one day be able to design drugs with all the functions of natural proteins, but which won’t be broken down by the body.
As a student at Yale you are situated on central campus, midway between Science Hill to the north, with its laboratory and classroom buildings, and the School of Medicine to the south. Both are just a ten-minute walk from central campus. Altogether that means hundreds of labs, each pursuing different kinds of research and easily accessible to where students live and work. Here you will find the kind of research that may interest you.

The Connected Campus.

(Designed for easy access)
Building the Future.

(Investing in new facilities, fueling new discoveries)

A new era of discovery is changing lives for the better in every part of the globe—and Yale is prepared as few institutions are to advance knowledge and apply it to today’s greatest challenges. Having recently concluded a decade-long, $1 billion program of expansion and renovation of STEM facilities, we continue to devote significant resources to strengthening Yale’s capacity for interdisciplinary research in science, engineering, and medicine. Some of our newest buildings, initiatives, and student projects are featured here.

Kroon Hall (left) Kroon Hall, home to Yale’s School of Forestry & Environmental Studies, completed in 2009. Certified LEED Platinum by the U.S. Green Building Council, it is a showcase of the latest developments in green building technology, a healthy and supportive environment for work and study, and a beautiful building that actively connects students, faculty, staff, and visitors with the natural world. Kroon is an anchor for long-term sustainable development of our Science Hill.

Center for Science and Social Science Information (above) CSSSI opened in 2012 in Kline Biology Tower on Science Hill. A collaboration between the University Library and ITS, it offers state-of-the-art information services in a technology-rich environment. Among its resources are computer workstations with comprehensive software suites, group study and presentation preparation rooms with video recording capabilities, a StatLab computer classroom with dual-display workstations and new collaborative technologies, and an on-site 180,000-volume print collection as well as an extensive and growing electronic collection. Librarian subject specialists and tech support staff offer high-level research support, including assistance with discipline-specific software.

Science Hill

From nuclear physics to new molecule synthesis, from ecosystem and conservation biology to genetic and optical investigations, Science Hill facilities foster cutting-edge, cross-disciplinary research.
Yale Engineering

It is an exciting time to be in Yale Engineering, with $50 million in funding for new faculty; increased support for undergraduate research opportunities, student associations, and entrepreneurship initiatives; and continued infrastructure growth. Whether it’s nanoscience, targeted drug delivery, or sustainability issues, our faculty and students are engaged in the most innovative research of our time.

Center for Engineering Innovation and Design

The new Yale Center for Engineering Innovation and Design is an 8,500-square-foot facility, with adjoining café and high-tech study space. It offers Yale students an unparalleled environment for collaborative design and innovation, with group work areas, meeting rooms, and fabrication facilities for metal, plastics, wood, biomedical materials, and electronic devices. It is an intellectual hub where people with common interests exchange ideas, learn from one another, and hone the skills that are needed to create engineering solutions to challenging, real-world problems.

“An intellectual hub where people with common interests exchange ideas, learn from one another, and hone the skills that are needed to create engineering solutions to challenging, real-world problems,” says director Eric Dufresne, John J. Lee Associate Professor of Mechanical Engineering and Materials Science. “The center will help students bridge the gap between formal course work and the real challenges that face society.”

Courses, workshops, and projects at the center require the application of a broad array of engineering principles and bring together students and faculty in all of Yale’s engineering majors—biomedical, chemical, electrical, environmental, and mechanical. But the center is open to students in all majors, for both academic and extracurricular projects. "Innovation is catalyzed by people with diverse back-grounds working together to attack the same problem," says Dufresne.

Center for Engineering Innovation and Design

The new Yale Center for Engineering Innovation and Design is an 8,500-square-foot facility, with adjoining café and high-tech study space. It offers Yale students an unparalleled environment for collaborative design and innovation, with group work areas, meeting rooms, and fabrication facilities for metal, plastics, wood, biomedical materials, and electronic devices. It is an intellectual hub where people with common interests exchange ideas, learn from one another, and hone the skills that are needed to create engineering solutions to challenging, real-world problems.

“The center empowers Yale students to realize their creative visions,” says director Eric Dufresne, John J. Lee Associate Professor of Mechanical Engineering and Materials Science. “The center will help students bridge the gap between formal course work and the real challenges that face society.”

Courses, workshops, and projects at the center require the application of a broad array of engineering principles and bring together students and faculty in all of Yale’s engineering majors—biomedical, chemical, electrical, environmental, and mechanical. But the center is open to students in all majors, for both academic and extracurricular projects. "Innovation is catalyzed by people with diverse back-grounds working together to attack the same problem," says Dufresne.

Anchored in the outstanding liberal arts tradition of Yale College, the center delivers a unique design and engineering experience.

Malone Engineering Center

This five-story, 64,700-square-foot laboratory building was completed in 2005 and achieved a LEED Gold rating for sustainable design. The research and teaching that take place at Malone focus on the forefront areas of biomedical engineering, materials science, and nanotechnology and bring together in full partnership faculty from the Schools of Engineering & Applied Science and Medicine. Designed to be comfortable, practical, elegant, and high-tech, it offers students and faculty ready access to the latest equipment, computers, and communications technology.

Courses, workshops, and projects at the center require the application of a broad array of engineering principles and bring together students and faculty in all of Yale’s engineering majors—biomedical, chemical, electrical, environmental, and mechanical. But the center is open to students in all majors, for both academic and extracurricular projects. "Innovation is catalyzed by people with diverse back-grounds working together to attack the same problem," says Dufresne.

Anchored in the outstanding liberal arts tradition of Yale College, the center delivers a unique design and engineering experience.
Yale Medicine

On Yale’s medical campus, just three blocks from the College, leading thinkers in fields from genetics to biomedical engineering and nanoscience, as well as researchers and physicians working on cancer, neurological disorders, and cardiovascular disease, break new ground every day. You can take classes taught by medical school faculty, work in their labs, shadow doctors on their rounds, and volunteer at Yale-New Haven Hospital. And the research opportunities available to undergraduates at the School of Medicine are extraordinary.

Cellular Neuroscience, Neurodegeneration, and Repair Program

MB&B major Ryan Park (left) is working toward a joint B.S./M.S. degree. His project uses biochemical and high-resolution imaging methods to study the role of a protein called dynamin in membrane trafficking.

Department of Cell Biology

MCDB major Henrietta Bennett (below) is working on a project focused on the association between telomeres and the nuclear envelope—a hot topic in the aging field.

MCDB major Sunny Jones studies the mechanisms of SNAREs, proteins that fuel the trafficking of vesicles through the Golgi apparatus of the cell.

Departments of Dermatology and Genetics

MB&B major Jonathan Fisher is studying genetic mutations that lead to skin cancer.

Department of Immunobiology

MCDB major Christopher Chow is working on the cells that control the immune system’s reaction to viruses.

Department of Anesthesiology

BME-Economics major Michelle Tseng is working on the implantation of engineered lung tissue into rats, with the long-range goal of creating a tissue-engineered lung.

Departments of Biomedical Engineering, Therapeutic Radiology, and Pediatrics

BME major Kavitha Anandalingam is working on the use of polymer nano-particles to deliver DNA constructs for gene therapy of cystic fibrosis.

Departments of Internal Medicine, Diagnostic Radiology, and Biomedical Engineering

BME major Nimit Jain is developing mathematical models to analyze MRS data to track metabolism in the human liver.

“...You don't have to be pre-med to take advantage of the great opportunities and great mentors in laboratories at the medical school. I work in a cell biology lab studying interactions between chromosomes and the nuclear envelope in fission yeast. Our work is medically relevant, but it's also interesting from the perspectives of general biology and biophysics. After all, good science is collaborative and interdisciplinary. My research at the medical school and my relationships with my lab members have been the most rewarding and productive of my experiences at Yale.”

MCDB major Henrietta Bennett
At its West Campus, Yale is building something entirely new: a distinctive scientific community that facilitates interactions between Science Hill and medical school scientists and engineers. Just a seven-minute shuttle ride from central campus, West Campus provides the physical and conceptual space for innovative collaboration. Six broadly multi-disciplinary research institutes here tackle problems and develop solutions that extend beyond traditional departmental boundaries, transforming the way biomedical, chemical, and engineering research is conducted at Yale.

**Cancer Biology Institute** focusing on fundamental and translational cancer biology, driving research through the pursuit of novel therapeutics.

**Chemical Biology Institute** emphasizing research in synthetic biology and products biosynthesis; the pursuit of novel, biologically active small molecules is the backbone of the institute.

**Energy Sciences Institute** focusing on the challenges facing the environment and energy sectors, from alternative and sustainable fuels to carbon mitigation technologies and energy storage.

**Microbial Diversity Institute** the first of its kind, focused on discovering, characterizing, and harnessing the microbial world by investigating microbe-based processes in the environment and in health.

**Nanobiology Institute** focusing on the discovery of principles that unite living and synthetic materials at the nanoscale.

**Systems Biology Institute** focusing on the biology of regulatory networks, particularly the biology of gene regulatory networks that underlie the identity and life of cells, providing a springboard for the integration of mathematical theory and bioinformatics.

"I've been doing my senior research project in assistant professor Farren Isaacs's lab in the Systems Biology Institute. The Isaacs Lab is focusing on extending the results of a technology called multiplex automated genome engineering (MAGE). MAGE can be used as a powerful genome editing tool. My project is designed to increase the efficiency of MAGE, making possible an in vivo gene synthesis platform. Each time I come to the lab I’m amazed by the sheer acreage of West Campus. The opportunities for growth here are extraordinary. I can't wait to see what it looks like in a few years."  
Mathematics and mcb m major 
Joshi Pun
A remarkable commitment to and capacity for teaching undergraduates sets Yale apart from other great research universities. To get a good sense of just how integrated undergraduate teaching and world-class research are here, one only needs to compare the overlap in faculty names between those making research breakthroughs and those listed in the Yale course catalog. Faculty say some of their best research ideas are often sparked in the classroom. Students say they are amazed by the incredible access they have to people who really are changing the world through science and engineering. We asked some of these great teachers and researchers why Yale is an extraordinary place to study and practice science and engineering.

**Q** What sets the Yale science and engineering experience apart from those at other research universities?

**Kyle Vanderlick** “The very things that make Yale a great place to conduct research also make the University a great place to learn. Students have access to world-class scholars, state-of-the-art facilities, and a collaborative culture supporting exploration and personal development. In short, engineering is about pushing the boundaries of what mankind can do through technological innovation. This simply cannot be done without a broad understanding of humanity, nor without the rich set of communication skills necessary to convey new and complex ideas. This is what engineering at Yale is all about.”

**Mark Saltzman** “There’s something different about rigorous training in engineering embedded in a liberal arts tradition. One of the features of a liberal arts education is that you’re required to take courses in all sorts of different things. For instance, we think it’s important that our students study a foreign language as well as the social sciences. Taking different kinds of classes creates a different sort of curiosity. Our students bring that curiosity to the kinds of questions they’re asking and trying to answer in science classes and engineering research labs. It’s certainly a different experience than at other places I’ve been where, if you’re an engineering or science major, you’re studying the same kinds of things in the same kind of way that other students around you are studying. You’re also living with other science and engineering majors. Here, students are living among future historians, future economists, English majors, and political science majors, all bringing their own brands of thought to questions and ideas.”

**Q** How are classroom science and engineering different from research in the lab?

**Meg Urry** “What we teach in science classes are tools and a way of thinking. The tools are basic concepts like gravity, forces, acceleration, motion, thermodynamics, and fluids that are manifested everywhere in nature. In the lab, we apply those concepts to different aspects of nature. In my own
Elsewhere in physics we might think about the behavior of fundamental particles or atoms or molecules. Not sorts of tools. Some are rather generic, hot plasmas and relativistic particles, are quite specialized, like a pulley puller for success in research. Like Meg, I think of it as filling a toolbox with all sorts of tools. Some are rather generic, like hammers and saws, and some are quite specialized, like a pulley puller or a plumber’s basin wrench. Not every project will need every tool, but the more you have in your toolbox, the better equipped you’ll be to tackle something new. The daily practice of science is characterized by creatively and innovatively solving research problems with all the tools at one’s disposal. By definition, you’re doing things in a research setting that have never been done before. That’s what makes it research, after all. I think the creative aspects of scientific research are often overlooked or underestimated.

Mark Saltzman “That is the obvious difference—that in the classroom you’re talking about accumulated knowledge and ideas that have been tested and known in lots of different ways, so it’s not so controversial or open-ended. Almost everything you do in a research laboratory is open-ended, and there is not any one way to get from point A to point B. Sometimes you don’t even know what point B is. You’re probing to find it in different ways and you don’t know what the outcome will be.”

Meg Urry “It’s like the difference between learning to speak French well (understanding basic physics concepts) and reading French literature (working in a physics lab). You have to do the first in order to do the second.”

Charles Schmuttenmaer “Beyond a strong background and ability in math and science, I look for people who can solve problems independently while working with others on a team. It is not a situation where I have all the answers and dol[e] out my knowledge to them. I look for people who are resourceful. People who leave no stone unturned when confronted with data that doesn’t seem to make sense. The sooner young researchers learn that the information they need will not be neatly packaged in some particular textbook, the sooner they will be successful.”

John Harris “We are looking for students who are excited about science and are motivated to learn new concepts and make new discoveries. They need to think independently and for the benefit of success of the research project and team. In terms of skills, they need to have the ability to understand new concepts, to clearly articulate questions and ideas, and to communicate their questions, ideas, and concepts to others.”

Joan Steitz “Communication skills are essential. In experimental science you’re starting from a tradition of knowledge. From there you put together a hypothesis and test that hypothesis. But this is always done by people talking to each other, people evaluating each other’s data. Yale is particularly good at teaching students how to communicate at a high level with faculty, postdocs, and research subjects.”

Meg Urry “They need to be smart, motivated, persistent, and good communicators. No one of those qualities is sufficient in and of itself—they need all four. They have to want to discover new knowledge; they have to master the tools of discovery; they need to be able to finish a project, however well-packaged in some particular textbook, the sooner they will be successful.”

Joan Steitz “The old idea of a scientist being an iconoclast who has a brilliant idea and then goes into the lab and does an experiment all by him- or herself, looks at the data, and then comes to a lofty conclusion is so faulty. Students here learn how communal the scientific enterprise is.”
many snags they may encounter; and they need to be able to communicate their results to others, preferably in an articulate and exciting way."

Q

Based on your personal experience of being an active research scientist, what do you think students need in order to be successful?

Joan Steitz “What every scientist who succeeds comes to appreciate is that there is really something very special about discovering something—no matter how small it is—that nobody else has ever known. When you first develop that film or look under the microscope and discover something new, you’re the only person in the universe with that knowledge. You have to be turned on by the curiosity to ask new questions and by the joy of finding the answers. As an undergraduate, because my role in labs had always been helping someone else on that person’s project, I didn’t understand how exciting it was to have my own project. I became completely hooked after that. In my lab, I make sure every undergraduate has his or her own project from the start. Even though they are working closely with somebody who knows more and who obviously cares whether their project succeeds or not, it is completely up to the undergrad as to whether that project succeeds. It’s theirs.”

Kyle Vanderlick “Quantitative reasoning, teamwork, and the habit of breaking complex problems into manageable pieces—these are the skills needed to be a successful engineer. Engineering is a purposeful and powerful way of thinking. It prepares students for fulfilling careers in engineering right after college, but in the classroom they have human examples of paths they might want to replicate in some way.”

Meg Urry “I agree. The process of doing science is a bit like an apprenticeship. We show them how to ask a question, how to find the answer, and then we help them learn to present their results to others. And along the way, I hope we also show them that teaching is one we love and enjoy, and that somehow people use the examples that they see in order to envision their own path. That is why it’s so important for working scientists and students to be in the classroom together. Students can get the facts from any number of places, but in the classroom they have human examples of interesting ways to approach problems, human examples of paths they might want to replicate in some way.”

Kyle Vanderlick “Engineering today at Yale is very different from its inception in the mid-1800s. We’re not building bridges, we’re curing diseases, cleaning and protecting our environment, computing at the quantum scale, and solving the energy crisis. More than an education in technological innovation, Yale engineering is a curriculum for leadership in the twenty-first century.”

and by the joy of finding the answers. As an undergraduate, because my role in labs had always been helping someone else on that person’s project, I didn’t understand how exciting it was to have my own project. I became completely hooked after that. In my lab, I make sure every undergraduate has his or her own project from the start. Even though they are working closely with somebody who
#1 Pivotal Moment
By the time May of my senior year arrived, I could project a checkerboard of dots in the air. No one seemed particularly impressed except my adviser, Professor Peter Kindlmann, who gave me exceptional guidance, and the department chair, Professor Mark Reed, who pledged departmental financial support.

It All Started at Yale
For my senior project as an electrical engineering major, I created a three-dimensional projection system. The system exploited the persistence of human vision by projecting one-dimensional images very quickly onto a rotating screen so that a viewer’s eyes perceived an aggregate 3-D image.

Today
I work at Optics for Hire, which acquired the 3-D patents from my company, Actuality Systems, in 2009. Optics for Hire invents or improves optics-based products. For example, for 3-D we made a handheld lightgun that uses diffraction to inspect giant turbine blades. For medical device companies, we’ve created optical blood inspectors and complex lenses. People call us for everything from "greenlight" (LED lighting) to video game technologies to laser-based measurement systems.

#2 Pivotal Moment
Things finally started to turn around. I met a journalist known for chronicling the happenings of Silicon Valley. After watching an image of the HIV virus rotating in space projected from my 3-D prototype, he wrote an article for the Wall Street Journal on the invention and my difficulty finding funding. Soon I had so many offers I had to turn investors away.

“While it’s true that not every senior project can turn into a successful start-up company, I implore engineering majors to embrace the opportunity to do a design project and to apply a ridiculous amount of persistence to it, because there’s nothing like the feeling of having made this thing that no one else in the world has ever made before.”

#1 Pivotal Moment
Persistence and Patent
I knew I was onto something. By the end of the summer after graduation, my projector was displaying 3-D images of Homer Simpson’s head, an air traffic scene, and the letter “Y.” This made believers out of a bigger circle of people and I earned a patent for the invention.

Investor Search
As this three-year investor search followed. It was the height of the dot-com boom. Investors were pumping huge amounts of money into the craziest of dot-com ventures, but no one was interested in work with three-dimensional images that could potentially help surgeons operate on cancer patients. Meanwhile, my parents were buying me groceries, and my team of engineers was living off McDonald’s Bag of Burgers special—six for $5. Things looked bleak.

Why Yale
Everything you hear and read about Yale’s commitment to undergraduates is completely true. You get a front-row ticket to theory and practice. Best of all, your future opportunities, whether you become a professional engineer or not, really are right at your fingertips.

High School
What began as a dream in high school became real at Yale, and today continues to lead me along a path of corporate leadership, technology, and invention.

Yale undergraduates studying science and engineering are ideally positioned for top Ph.D. programs and career success. Here, three graduates trace the major steps they took to get where they are today.
“The best thing about Yale is the students. It was great to learn about the ultimate fate of the universe in a cosmology class, but it was even better to sit down at dinner with some philosophy majors to sort out what it all meant.”

Laura Kreidberg
Hometown
Reno, NV
Yale Class of 2011
B.A. Astronomy and Physics
Current Ph.D. candidate, Astrophysics, University of Chicago

Current Work
I am a Ph.D. candidate at University of Chicago. I am interested in astrophysics—using Bayesian methods, time series analysis, machine learning, and other techniques to maximize the science we can obtain from astromonical data sets, both large and small. My current research focuses on optimizing the planet detection algorithm used by the Kepler mission.

Valuable Takeaways
What a fantastic preparation for a career in science Yale was for me. Not only were the science classes and research opportunities extremely strong, but I developed my communication and leadership skills. For example, helping to organize the Northeast Conference for Undergraduate Women in Physics, a three-day event with 100+ participants, taught me teamwork and how to finish projects with strict deadlines—two essentials for success in a scientific career.

#2 Pivotal Moment
My senior project adviser, Professor Charles Bailyn, was hugely influential in my path to grad school. He helped me identify a high-impact research project on black holes that was a perfect fit to my interests. Through close collaboration with him (we met at least once a week), I learned how to assess promising new research directions, think critically about papers, justify assumptions, and write convincingly about my work. These skills have really jump-started my research program in grad school.

Early Inspiration
When I was the captain of my high school Science Bowl team, my coach encouraged me to pursue my interest in astrophysics. He helped me find some great introductory textbooks and inspired me to study astronomy and physics in college. The extra studying also helped my team win the state championship!

#3 Pivotal Moment
Why Yale
Yale students stood out because of their sense of humor and enthusiasm for both academics and everything else. I aspire to be like them.

High School
I began looking at the world through the eyes of chemistry and physics, which was an empowering experience that drove me toward studying science later.

Why Yale
I came to Yale when undergraduate science was being re-invigorated through programs like Perspectives on Science. Seeing Yale’s interest in nurturing undergraduates in science appealed to me. Other schools also offered great programs, but Yale seemed most interested in me as a young scientist. My experiences later proved that to be true.

Novel Research
In my research group, I had my own project and worked individually under my adviser. I was not simply performing busywork for a graduate student. Professors at Yale take undergraduate education and research very seriously. They try to find a good niche for an undergraduate to contribute to novel research while learning an immense amount.

Current Work
My work at Exponent involves failure analysis and materials characterization related to polymers and plastics, adhesives, and coatings.

#1 Pivotal Moment
I realized I wanted to be a scientist while I was writing a paper on Hamlet for an English class freshman year. The crux of my argument was that a character’s importance could be measured even to Shakespeare, I decided the sciences would be the best fit for me.

BONUS
Yale attracts very talented scientists who are also interesting people. You’re a full-fledged member of the scientific community—not an undergraduate underling.

Grad School Dividend
I have a much larger breadth of knowledge than most other graduate students in my department, particularly because of my course work and research at Yale. I was encouraged to take courses that spanned a wide range of scientific topics. That has paid large dividends down the line.

There are lots of technologies out there waiting for the right moment to really impact the planet in a positive way. I want to position myself to help those technologies come alive.”
Lives.

Freshman Diaries. Yale’s newest students chronicle a week in the first year and give some advice.

Anatomy of a Residential College. Yale’s residential college system is unparalleled and enhances the pleasure of attending Yale like nothing else. Far more than dormitories, our 12 residential colleges have been called “little paradises” — endowed with libraries, dining halls, movie theaters, darkrooms, climbing walls, ceramics studios, and many other kinds of facilities — and each has its own traditions. Each college is home to a microcosm of the undergraduate student body as a whole. (For science and engineering majors this means that your friends will be actors and economists, musicians and linguists, artists and historians as well as biologists and physicists.) With their resident deans and masters, affiliated faculty, legendary intramural sports teams, and Master’s Teas with world leaders, the residential colleges are an incomparable experience.

Bright College Years. In many ways friendship defines the Yale experience. One student sums it up: “It’s about the people, not the prestige.”

Studies.

A Liberal Education. Freedom to think. Yale’s educational philosophy, more than 80 majors, the meaning of breadth, and some startling numbers.

College Meets University. An undergraduate roadmap to the intersection of Yale College and the University’s graduate and professional schools.

Blue Booking. Yale is one of the only universities in the country that lets you test-drive your classes before you register during what’s known as “shopping period.” Preparing to shop is a ritual in and of itself, signaled by the arrival online of the Blue Book, Yale College’s catalog of more than 2,000 courses.

Eavesdropping on Professors. Why being an amazing place to teach makes Yale an amazing place to learn.

Two, Three, Four, Five Heads Are Better Than One. Why Yalies like to learn together.

Next-Gen Knowledge. For Yalies, one-of-a-kind resources make all the difference.

Think Yale. Think World. Over and above ordinary financial aid, Yale awards more than $6 million for fellowships, internships, and relief from summer earnings obligations in order to guarantee that every student who wishes will be able to work or study abroad. Eight Elis define “global citizen” and share their pivotal moments abroad.

Connect the Dots. From start-up capital and internships to top fellowships and a worldwide network of alumni, Yale positions graduates for success in the real world.

Places.

Inspired by Icons. Why architecture matters. Among the nation’s oldest universities, Yale is the one most firmly defined by its architecture.

State of the Arts. From the digital to the classical, Yale’s spectacular arts options.

Pursuits.

Bulldog! Bulldog! Bow, Wow, Wow! Playing for Yale — The Game, the mission, the teams, the fans, and, of course, Handsome Dan.

Shared Communities. Yale’s tradition of Cultural Houses and affinity organizations and centers.

ELiterati. Why Elis are just so darned determined to publish.

Sustainable U. Where Blue is Green.

Political Animals. Today’s and tomorrow’s leaders converge at the Yale Political Union, the nation’s oldest debating society.

Keeping the Faiths. Nurturing the spiritual journeys of all faiths.

Difference Makers. Through Dwight Hall, Yale’s Center for Public Service and Social Justice, students find their own paths to service and leadership in New Haven.
If you are considering Yale, please do not hesitate to apply because you fear the cost will exceed your family’s means. Yale College admits students on the basis of academic and personal promise and without regard to their ability to pay. All aid is need-based. Once a student is admitted, Yale will meet 100% of that student’s demonstrated financial need. This policy, which applies to U.S. citizens and to international students alike, helps to ensure that Yale will always be accessible to talented students from the widest possible range of backgrounds.

The Financial Aid Office is committed to working with families in determining a fair and reasonable family contribution and will meet the full demonstrated need of every student for all four years with an award that does not require loans. Today, 53% of undergraduates qualify for need-based scholarships from Yale. The average annual grant from Yale to its students receiving aid for the 2013–2014 school year was $66,000 (with typical assets) contribute a percentage of their yearly income toward a student’s Yale education, on a sliding scale that begins at 1% and moves toward 20% and higher.

> Yale Financial Aid Awards do not include loans. 100% of a family’s financial need is met with a Yale Grant and opportunities for student employment.
> Families with annual income below $65,000 (with typical assets) are not expected to make a financial contribution toward a student’s Yale education. 100% of the student’s total cost of attendance will be financed with a Yale Financial Aid Award from Yale.
> Families earning between $65,000 and $100,000 annually (with typical assets) contribute a percentage of their yearly income toward a student’s Yale education, on a sliding scale that begins at 1% and moves toward 20% and higher.
> Yale awards all aid on the basis of financial need using a holistic review process that considers all aspects of a student’s financial situation.

Yale Net Price Calculator

admissions.yale.edu/yale-net-price-calculator

To help estimate your Yale financial aid award before you apply, we encourage you to use the Yale Net Price Calculator. The calculator generates a sample financial aid award based on the information you supply and on Yale’s current aid policies. The process should take less than ten minutes. The calculator cannot capture all the information an aid officer would use to evaluate your financial need, but it should provide a useful and starting point.
